

# Chapter 6: Basic SQL

## Database Systems CS203

Week 04

17<sup>th</sup>-19<sup>th</sup> Sep-2018

# Outline

- SQL Data Definition and Data Types
- Specifying Constraints in SQL
- Basic Retrieval Queries in SQL
- INSERT, DELETE, and UPDATE Statements in SQL
- Additional Features of SQL

# Basic SQL

- SQL language
  - Considered one of the major reasons for the commercial success of relational databases
- SQL
  - The origin of SQL is relational predicate calculus called tuple calculus (see Ch.8) which was proposed initially as the language SQUARE.
  - SQL Actually comes from the word “SEQUEL” which was the original term used in the paper: “SEQUEL TO SQUARE” by Chamberlin and Boyce. IBM could not copyright that term, so they abbreviated to SQL and copyrighted the term SQL.
  - Now popularly known as “Structured Query language”.
  - SQL is an informal or practical rendering of the relational data model with syntax

# SQL Data Definition, Data Types, Standards

- Terminology:
  - Table**, **row**, and **column** used for relational model terms relation, tuple, and attribute
- CREATE statement
  - Main SQL command for data definition
- The language has features for : Data definition, Data Manipulation, Transaction control (Transact-SQL, Ch. 20), Indexing (Ch.17), Security specification (Grant and Revoke- see Ch.30), Active databases (Ch.26), Multi-media (Ch.26), Distributed databases (Ch.23) etc.

# SQL Standards

- SQL has gone through many standards: starting with SQL-86 or SQL 1.A. SQL-92 is referred to as SQL-2.
- Later standards (from SQL-1999) are divided into **core** specification and specialized **extensions**. The extensions are implemented for different applications – such as data mining, data warehousing, multimedia etc.
- SQL-2006 added XML features (Ch. 13); In 2008 they added Object-oriented features (Ch. 12).
- SQL-3 is the current standard which started with SQL-1999. It is not fully implemented in any RDBMS.

# Schema and Catalog Concepts in SQL

- We cover the basic standard SQL syntax – there are variations in existing RDBMS systems
- **SQL schema**
  - Identified by a **schema name**
  - Includes an **authorization identifier** and **descriptors** for each element
- **Schema elements** include
  - Tables, constraints, views, domains, and other constructs
- Each statement in SQL ends with a **semicolon**

# Schema and Catalog Concepts in SQL (cont'd.)

- **CREATE SCHEMA statement**

- `CREATE SCHEMA COMPANY  
AUTHORIZATION 'Jsmith';`

- **Catalog**

- Named collection of schemas in an SQL environment

- SQL also has the concept of a cluster of catalogs.

# The CREATE TABLE Command in SQL

- Specifying a new relation
  - Provide name of table
  - Specify attributes, their types and initial constraints
- Can optionally specify schema:
  - `CREATE TABLE COMPANY.EMPLOYEE`  
...
  - or
  - `CREATE TABLE EMPLOYEE` ...

# The CREATE TABLE Command in SQL (cont'd.)

- **Base tables (base relations)**
  - Relation and its tuples are actually created and stored as a file by the DBMS
- **Virtual relations (views)**
  - Created through the `CREATE VIEW` statement. Do not correspond to any physical file.

# SQL CREATE TABLE data definition statements for defining the COMPANY schema from Figure 5.7 (Fig. 6.1)

## CREATE TABLE EMPLOYEE

( Fname	VARCHAR(15)	NOT NULL,
Minit	CHAR,	
Lname	VARCHAR(15)	NOT NULL,
Ssn	CHAR(9)	NOT NULL,
Bdate	DATE,	
Address	VARCHAR(30),	
Sex	CHAR,	
Salary	DECIMAL(10,2),	
Super_ssn	CHAR(9),	
Dno	INT	NOT NULL,

**PRIMARY KEY** (Ssn),

## CREATE TABLE DEPARTMENT

( Dname	VARCHAR(15)	NOT NULL,
Dnumber	INT	NOT NULL,
Mgr_ssn	CHAR(9)	NOT NULL,
Mgr_start_date	DATE,	

**PRIMARY KEY** (Dnumber),

**UNIQUE** (Dname),

**FOREIGN KEY** (Mgr\_ssn) **REFERENCES** EMPLOYEE(Ssn) );

## CREATE TABLE DEPT\_LOCATIONS

( Dnumber	INT	NOT NULL,
Dlocation	VARCHAR(15)	NOT NULL,

**PRIMARY KEY** (Dnumber, Dlocation),

**FOREIGN KEY** (Dnumber) **REFERENCES** DEPARTMENT(Dnumber) );

# SQL CREATE TABLE data definition statements for defining the COMPANY schema from Figure 5.7 (Fig. 6.1)-continued

## CREATE TABLE PROJECT

( Pname	VARCHAR(15)	NOT NULL,
Pnumber	INT	NOT NULL,
Plocation	VARCHAR(15),	
Dnum	INT	NOT NULL,
<b>PRIMARY KEY</b> (Pnumber),		
<b>UNIQUE</b> (Pname),		
<b>FOREIGN KEY</b> (Dnum) <b>REFERENCES</b> DEPARTMENT(Dnumber) );		

## CREATE TABLE WORKS\_ON

( Essn	CHAR(9)	NOT NULL,
Pno	INT	NOT NULL,
Hours	DECIMAL(3,1)	NOT NULL,
<b>PRIMARY KEY</b> (Essn, Pno),		
<b>FOREIGN KEY</b> (Essn) <b>REFERENCES</b> EMPLOYEE(Ssn),		
<b>FOREIGN KEY</b> (Pno) <b>REFERENCES</b> PROJECT(Pnumber) );		

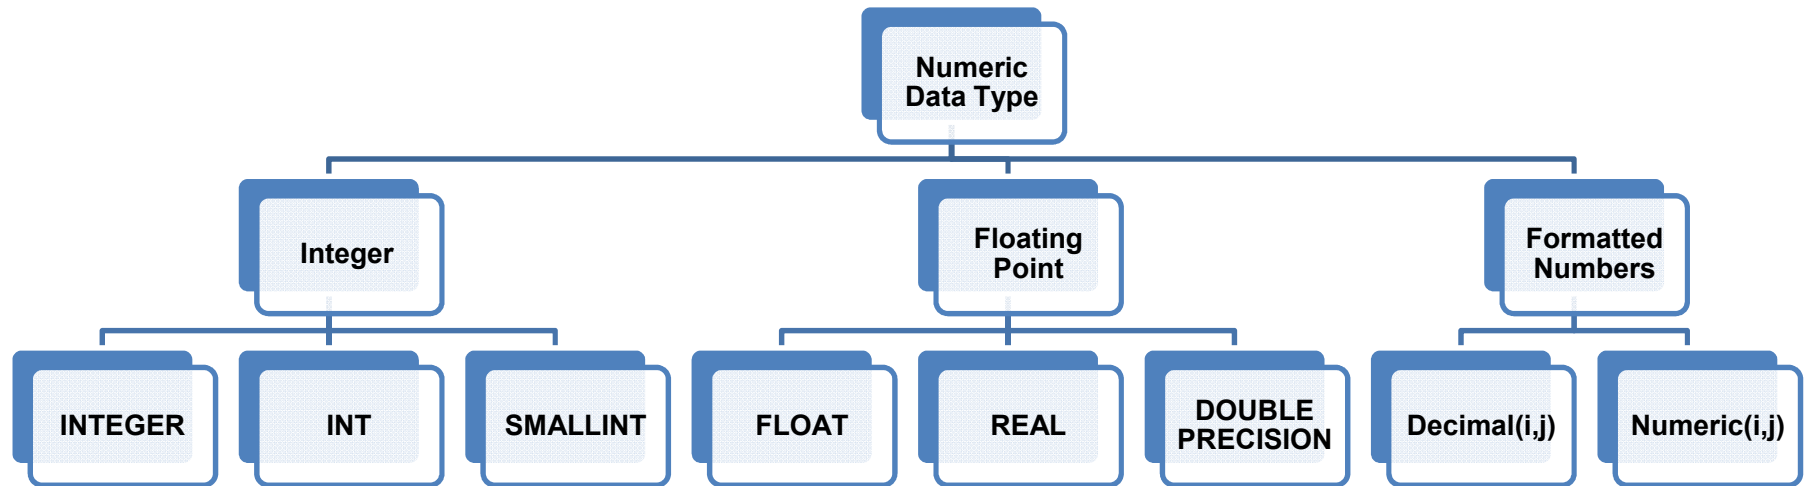

## CREATE TABLE DEPENDENT

( Essn	CHAR(9)	NOT NULL,
Dependent_name	VARCHAR(15)	NOT NULL,
Sex	CHAR,	
Bdate	DATE,	
Relationship	VARCHAR(8),	
<b>PRIMARY KEY</b> (Essn, Dependent_name),		
<b>FOREIGN KEY</b> (Essn) <b>REFERENCES</b> EMPLOYEE(Ssn) );		

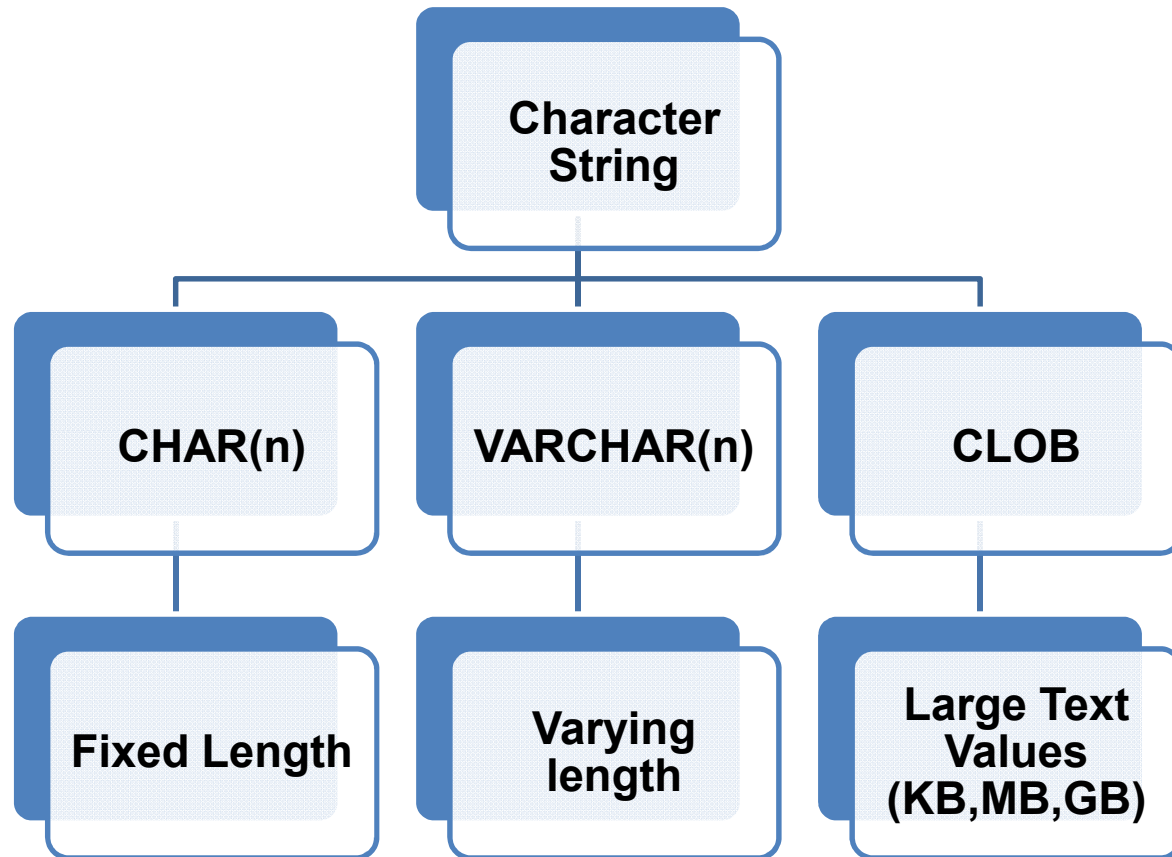

# The CREATE TABLE Command in SQL (cont'd.)

- Some foreign keys may cause errors
  - Specified either via:
    - Circular references
    - Or because they refer to a table that has not yet been created
- DBA's have ways to stop referential integrity enforcement to get around this problem.

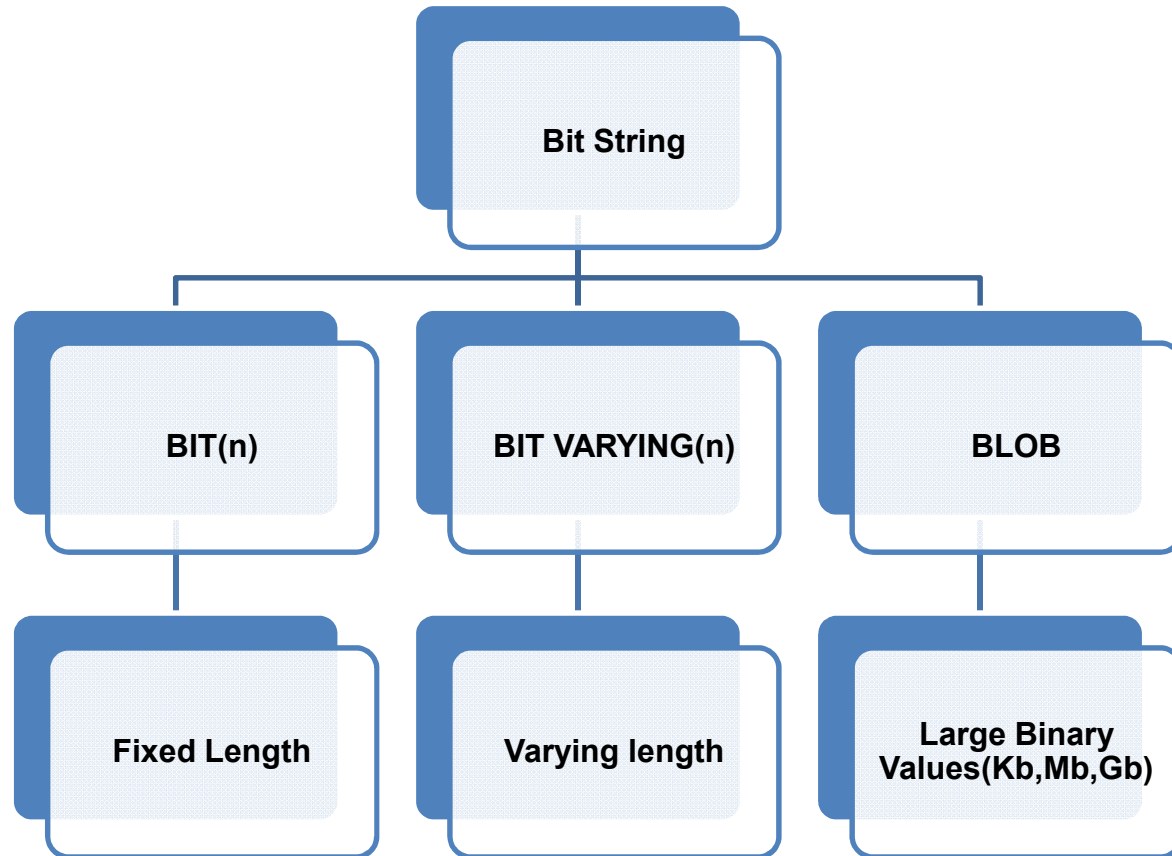

# Attribute Data Types and Domains in SQL

# Attribute Data Types and Domains in SQL

# Attribute Data Types and Domains in SQL

# Attribute Data Types and Domains in SQL

- **Boolean Data Type**

- True
- False
- NULL

- **Time**

- HH:MM:SS

- **Date**

- YYYY-MM-DD
- Multiple mapping functions available in RDBMSs to change date formats

- **Timestamp**

- TIMESTAMP '2014-09-27 09:12:47.648302'

- **Interval**

- Specifies a relative value that can be used to increment or decrement an absolute value of a date, time, or timestamp

• **DATE, TIME, Timestamp, INTERVAL** data types can be **cast** or converted to string formats for comparison

# Attribute Data Types and Domains in SQL

## •Domain

- Name used with the attribute specification
- Makes it easier to change the data type for a domain that is used by numerous attributes
- Improves schema readability
- Example:
  - `CREATE DOMAIN SSN_TYPE AS CHAR(9);`

## •TYPE

- User Defined Types (UDTs) are supported for object-oriented applications. (See Ch.12) Uses the command:  
`CREATE TYPE`
